size details

- a Chest measurement
- Breast measurement
- b Waist measurement
- c Waist length
- d Measurement from shoulder to shoulder
- e Sleeve length from shoulder to elbow
- f Sleeve length from elbow to wrist
- g Arm measurement
- h Wrist measurement
- i From waist to the ground
- l Desired trouser length measured from waist to ankle
- m From waist to middle of knee
- n From crutch to the ground
- o Thigh measurement (taken at 25 cm. from the knee)
- p Knee measurement
- q Ankle measurement
- r From crutch to knee middle taken on the inside with
- s Pelvis measurement
- t Forearm measurement
- u Calf measurement
- v Height of the person

IMPORTANT! We DO NOT accept complaints about sizes not taken by our tailors.

How to measure

This very important operation requires much preciseness and, for a perfect result of the made to measure track, we suggest to follow very carefully the indications (instructions,...) and the procedures described here below:

- In order to take the measures, another person's help is needed.
- Use the proper tape-measure, tailor's one.
- All the measures must be taken at the body, in this case the person should not be dressed heavily.
- The riders should take the measures without back-protection.
- During the different stages, you must be really careful not to turn inadvertently the tape-measure and moreover while measuring you should not hold it too tight, neither too loose.
- For the measures C - I - L - M, tie around the waist a tape as a datum point.
- Take out of your pockets and breast-pockets any handkerchiefs, wallets, keys, sweets, etc ...You do not need to take off your shoes.

Which are the essential points

A chest circumference: raise horizontally your arms, put the tape measure under your armpits, then lower them again. If it is a woman model specify also breast circumference.

B waist circumference: encircle with the tape measure your waist, making sure not to put it on top of a belt, braces or something else.

C waist length: measure your spine, putting with preciseness the tape measure on the most protruding vertebra at the base of your neck and continuing till your waist.

D shoulder tip: put the tape measure between the two extremities of the high bends of your shoulders, on the back of the person (usually the measure of the shoulders is nearly the same as the waist length).

E F sleeve length: bend your arm at the height of your waist and measure from the tip (high bend) of your shoulder till your elbow, and from your elbow till your wrist.

I L trouser length: measure with the tape measure along your hip starting from your waist and continuing till reaching the floor (I) and till the height wanted (L).

N crotch height: raise well the trousers at your waist, and, with your legs shut, measure from the centre of the crotch till floor (without taking off your shoes).

R Internal thigh: the person must be sitting with legs wide apart, measure starting from the centre of the crotch to the centre of internal side of the knee (normally this is a measure that changes from 40 to 43 cm approximately).

S pelvis circumference: encircle your hips with the measure tape at about 19-20 cm below your waist, making sure not to press too much. Make sure that the person has completely emptied the pockets.

V person height: measure the real height of the person without taking off the shoes.
